

It's 2 a.m.

Do you know what
your liner is doing?

VolantRED™ Liner

VolantRED™ helps your team make informed well construction decisions at anytime and from anywhere – with real-time liner running load limits straight from your rig to your fingertips.

VolantRED™ Liner

Introducing VolantRED™. A real-time system that extends your engineering to field operations to optimize your well construction decisions. It continuously acquires data from the rig to provide safe surface hook load and torque load limits as you run your liner – delivering an engineering basis for decisions when they matter most.

Bring your engineering to the rig.

VolantRED™ combines your pre-defined liner load limits with well-founded estimates of downhole loads to generate real-time, safe surface loading envelopes.

THE RESULT

Confidence that your liner running decisions are based on emerging downhole conditions and safeguard your entire liner.

Save critical time making informed installation decisions.

VolantRED™ calculates the load limits of every joint throughout the liner run, and combines them into composite surface load limits. Safe loading estimates are available every step of the way.

THE RESULT

Expedient and well-informed decision-making to reach TD in less time without compromising your liner's structural integrity.

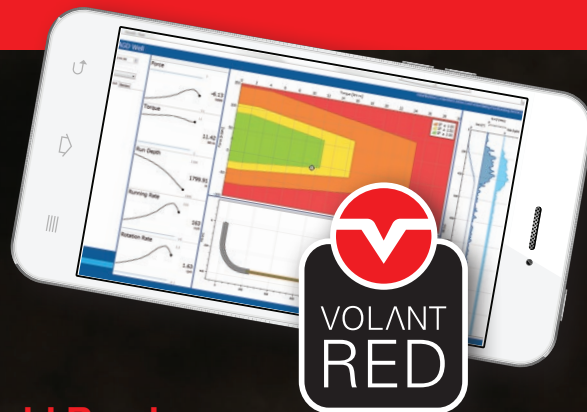

Verify your design and plan wells with confidence.

VolantRED™ prioritizes well integrity and quality assurance. It provides a comprehensive record of your well construction loads at surface and downhole¹, allowing you to confirm the quality of your installation and optimize your liner design for future projects.

THE RESULT

An enduring quality report to support your well integrity management program, and the evidence you need to build confidence in your designs and future well construction projects.

¹ Downhole load estimates are derived from real-time torque and drag calculations coupled with surface loads measured at the rig. Contact us for more details.

Field Ready.

VolantRED™ is leading the way to liner integrity and bringing clarity to actual downhole conditions. It's your field-ready solution to make informed, expedient decisions that reduce NPT and safeguard your assets in the face of unexpected running challenges.

- **DESIGNED** by Noetic Engineering.
- **DEVELOPED** with the input and field experience of Suncor Energy.
- **FIELD TESTED** on Suncor Energy SAGD wells.

It's 2 a.m. Do you know what your liner is doing? We can show you.

Talk to us about your most challenging well construction experiences. Give us the opportunity to demonstrate VolantRED™ in action.
